

WellSky Tagging Standards

Standard operating procedure

1. Purpose

This SOP consolidates tagging standards for WellSky that were previously communicated to staff through a series of individual emails from Kate Gumbert (Administrator). Consistent tagging supports accurate billing, compliance with state licensing requirements, caregiver safety, and reliable reporting across all Right at Home Central Texas offices.

2. Scope

Applies to all Client Care Managers (CCMs) and office staff across Austin West, Austin East, Marble Falls, Bastrop, and San Marcos who create, update, or review client and caregiver records in WellSky.

3. Procedure

3.1 Scheduling Communication Protocol

Applies to open shifts, fill-in shifts, and new client first shifts.

- Open Shifts: Always call the client first. If voicemail, follow up by text and log an open task with call/text status (e.g. "10:28 AM – LVM with client about open shift, sent Wavetext – EL").
- Fill-In Shifts: Always call the client first to inform them of the replacement caregiver. Same voicemail/text/task follow-up as above.
- New Clients & First Shifts: Complete a Welcome Call before the first scheduled shift. If voicemail, follow up with both text and email summarizing the attempt and key details (schedule, portal invite, contact number).
- End-of-Day: Review all open tasks before leaving. If tasks remain open or clients are uncontacted, hand off to the team so someone follows up.
- Wavetext Check: Review your area's Wavetext messages daily before end of day.
- Close the Circle on All Calls: Cancel shift → log note → open shift and follow communication protocol (incl. task) → post update in Trillian → send a private Trillian message to the responsible CCM(s), since the large group chat is not consistently monitored.
- Use the Task Dashboard as the system of record for what's been done, what's pending, and what's next.

3.2 Method of Payment Tags

Applies to all clients with the Private Pay tag.

- ACH Payer (Preferred): use whenever possible for private pay clients.
- Check Payer: requires Admin approval and a 2-week deposit before services begin or continue.
- CC Payer: requires Admin approval, a 2-week deposit, a \$2 processing fee to the client, and a service rate \$2/hour higher to cover administrative cost.
- All clients new since 1/1/26 should have the New CLT tag on their profile.
- Going forward: every new private pay client must have the correct payment method tag entered at intake, and tags must be reviewed whenever the payment method changes.

3.3 Transportation Tags

- Do Not Transport: use for Veteran, GUIDE, and AAA clients (transportation not covered by these programs), or any client without completed transportation waiver paperwork, or where transportation is not part of the approved care plan. Exception: a VA/GUIDE/AAA client with additional private-pay hours specifically for transportation may still get a driving tag.
- Driving – CLT Car: private pay client with both a signed Transportation Waiver and Client Vehicle Use Agreement on file. Caregiver uses the client's vehicle; client is not billed mileage.
- Driving – CG Car: private pay client with a signed Transportation Waiver who does not want the caregiver using their vehicle. Caregiver uses their own vehicle; client is billed mileage. Caregiver must be an RAH-approved driver with current auto insurance on file.

- Every new client must have the correct transportation tag at intake, reviewed whenever transportation needs or documentation change.

3.4 Pet Tags

- No Pets: no animals in the client's home.
- Pets in the Home: any pets present (dogs, cats, birds, etc.) that caregivers may interact with or be around during the shift.
- Review all current clients and confirm one of these tags is set; apply at intake for all new clients and re-check whenever the home situation changes.

3.5 Client Triage Tags

Triage should be marked at the top of the client intake paperwork. As a non-medical home care agency, most clients should be Triage III or IV — Triage I and II are reserved for clients who truly meet those criteria.

- Triage I – Life threatening (or potential): ongoing ADL assistance (ambulation, self-administered medications, transferring, assistive devices, toileting, meal prep, and/or feeding) with no willing or available caregiver present. Requires transportation assistance to hospital or specialized shelter. Electricity-dependent equipment should be registered with the power company; oxygen-dependent clients should have a back-up tank from the supplier.
- Triage II – Not life threatening: same ADL needs as Triage I, but a willing and able caregiver is present. Will require transportation assistance to hospital/shelter if necessary.
- Triage III – Visits could be postponed 24–48 hours: assistance with bathing, dressing, grooming, cleaning and/or laundry. Able to self-care or has a willing/able caregiver; transportation available from family/friends/others.
- Triage IV – Visits could be postponed 72–96 hours: symptoms well-controlled, temporarily able to self-care or has a willing/able caregiver; transportation available from family/friends/others.
- Review all current clients' triage levels; re-confirm accuracy every time the care plan is updated.

3.6 Compliance Tagging (Complaint Log & Infection Log)

These are license compliance requirements — notes tagged here may be provided directly to the state during surveys and must be clear, professional, and complete.

- Complaint Log: document every complaint reported by a client or caregiver, regardless of severity — from a caregiver being on their phone too much, up to allegations of abuse, neglect, or exploitation. The Administrator must be notified of all complaints, without exception, via a task created for Kate. Use tags: Complaint About Employee, Client Fall – No Injury, Client Fall – With Injury. These tags should only be used in tasks created for the Administrator.
- Infection Log: document illness involving clients or caregivers using Employee Sick or Illness Related Concern. Do not use these tags for a caregiver calling off due to a sick family member — they apply only to caregiver or client illness that results in canceled care.
- General Reporting Tags: use Client Quality Call and Caregiver Retention Call to track engagement and quality metrics.

3.7 PAS vs. Companion Tagging

This distinction is a state compliance issue — the state can audit PAS clients but cannot audit Companion clients.

- Companion: no hands-on care and no safety supervision. Includes housekeeping, non-hands-on meal prep, errands/transportation, socialization, and general assistance.
- PAS (Personal Assistance Services): any hands-on care or required safety supervision — bathing, dressing, grooming, mobility/transfer assistance, toileting/incontinence care, or any physical ADL assistance.
- Review the full client roster to confirm every client has PAS or Companion selected and that it matches the care plan; tag all new clients correctly at intake; re-confirm at every care plan review.

4. Common Errors to Avoid

- Leaving a client without any payment method, transportation, pet, or triage tag set.
- Using Employee Sick / Illness Related Concern for a caregiver calling off due to a sick family member.
- Logging a complaint as a general note instead of a task addressed to the Administrator.
- Posting an open-shift update only in the large Trillian group chat instead of messaging the responsible CCM directly.
- Defaulting new clients to a high triage level (I/II) when the majority of non-medical home care clients should be III or IV.
