

STANDARD OPERATING PROCEDURE

Caregiver Hiring Demand Tool

1. Purpose

This procedure explains how to use the Caregiver Hiring Demand Tool: a self-contained web tool that reads Wellsky exports and shows where caregivers should be recruited, which days and shift windows are hardest to staff, and which client areas have the weakest local caregiver supply. It replaces the manual, analyst-run version of this analysis so recruiters can refresh it themselves whenever they pull new exports.

2. Scope

Covers downloading the required Wellsky reports, loading them into the tool, and interpreting the results. The tool analyzes care that was delivered or scheduled; it does not pull live data from Wellsky. Each time fresh exports are loaded, the entire analysis is rebuilt from those files.

3. Prerequisites

- A current web browser (Edge, Chrome, or similar) with an internet connection.
- Access to the tool file (**hiring_tool.html**) — opened from disk or from the GitHub Pages hub.
- Wellsky access with permission to export the three reports listed in Section 5.

4. Required Wellsky Exports

Export the three reports below. The tool identifies each file automatically by its columns, so the file names do not matter, only the columns do. Care logs and caregivers are required; clients is optional (it only adds the active-client count).

Report	Must contain these columns	Notes
Care Logs	Scheduled Clock In, Scheduled Clock Out, Actual Clock In, Actual Clock Out, Caregiver Location, Caregiver Name, Client Name, Client City, Client Zip, Status	Required. The core demand signal.
Caregivers	First Name, Last Name, Inactive, City, Postal Code	Required. The local supply signal.
Clients	First Name, Last Name, Deactivated, City, Postal Code, Profile Tags	Optional. Adds active-client count only.

Filtering by region: Before exporting the Care Logs report, filter it by the client location for the region you are recruiting for (for example, client location = Marble Falls). The tool analyzes exactly the scope you export, so pull the region you intend to act on.

5. Procedure

1. Go to "Reports" and then click on "Custom".

2. Then, on "Saved Reports", look for "AP – Carelogs hiring demand tool", "AP – CGs Hiring Report" and "AP – CL hiring demand report"

3. You can filter all the reports per location

* Choose Report ⓘ

▼ AP - CGs Hiring Report Save

8 of 56 Selected Fields

Address Address 2 Inactive Deactivation Reason City First Name Last Name Postal Code +

Add Filter...

Include Location is Select Some Options +

Run Report

4. Once you are using the “AP – Carelog hiring demand tool”, you can also sew the range for the time that you want to analyze, if you use a large amount of carelogs, the stats will be more reliable

▼ AP - Carelogs hiring demand tool Save

12 of 150 Selected Fields

Actual Clock In Actual Clock Out Scheduled Clock In Scheduled Clock Out Caregiver Location Caregiver Name Client Name
Client Address Client Address 2 Client City Client Zip Status +

Caregiver Hiring Demand

Drop your WellSky exports below. The tool reads them in your browser, detects which is which, and rebuilds the full hiring analysis — every time you upload fresh exports.

Drop exports here or [browse](#)

care logs · caregivers · clients · .xls / .xlsx

Care logs required waiting...
Caregivers required waiting...
Clients optional waiting...

Generate analysis

Files never leave your computer — everything runs locally in the browser.

- Confirm each file turns green and is labeled correctly (Care logs, Caregivers, Clients) with a row count. If a file is not recognized, re-download the correct report.

- Click **Generate analysis**. The dashboard appears.
- Review the results using Section 6. Act on the priority areas.

- To refresh later, click **Load new exports** and drop in newer files. The analysis rebuilds instantly.

6. Reading the Dashboard

- **KPI strip:** Totals for the loaded scope, care hours, shifts, active caregivers and clients, weekend and overnight share, and the caregiver-cancellation rate.
- **The hiring map:** Each bubble is a ZIP. Bubble size = volume of care delivered there; color = the metric chosen in the toolbar (default is Hiring priority). Use the buttons to switch between priority, demand, local supply gap, weekend load, and cancel rate. The side list ranks the top-priority ZIPs; click one to fly to it.
- **By office:** Care delivered per branch (based on the Caregiver Location on each shift). When you filter to one region, this shows how much of the work is covered by caregivers from other branches.
- **By client city (sub-area):** The finer cut within a region. Each bar is a client city; bar color shows local caregiver supply, red = none live there, orange = 1–2, blue = 3+. A long red bar is a recruiting target inside the region.
- **When (days & shifts):** Demand by day of week and by shift window. Bar height is demand; bar color is the cancel rate (redder = harder to keep staffed). The grid shows where demand concentrates across the week.
- **Weekends:** Weekend hours and weekend cancel rate per office.
- **Clients with heaviest need:** Top clients by care hours, with their weekend and overnight share.
- **Recommendations:** Plain-language actions regenerated from the loaded data.

7. Interpretation Guide

- **Hiring priority** blends demand volume, how thin local caregiver supply is, weekend load, and caregiver-driven cancellations into one 0–100 score.
- **Local supply gap** is delivered hours divided by the active caregivers who live in that ZIP. A high gap means the area is served by caregivers traveling in — a strong local-hiring signal.
- **Zero local caregivers** (red sub-area bars, or strain on the map) is the clearest where-to-hire signal.
- **Cancel rate** is the share of shifts cancelled by a caregiver or missed (no-show). A high rate signals strained or unreliable coverage.

8. Troubleshooting

Symptom	Likely cause	What to do
A file shows as not recognized	Wrong report, or required columns missing	Re-download the correct WellSky report; confirm the columns in Section 5 are present
Map area is blank but tables show data	No internet connection for the map tiles	Connect to the internet and reload; all other sections still work offline
Nothing happens when files are dropped	Office network is blocking the Excel-reader library	Try another network, or ask the Client Care Manager for the fully-offline build
Numbers look smaller than expected	The export was filtered to one region	Expected — the tool analyzes only what you export. Re-export the scope you want
Active caregiver count is slightly lower than the roster	Placeholder / internal rows are excluded	Expected — rows with an all-capitals first and last name are removed as non-caregivers

10. Limitations & Caveats

- The tool measures care that **was covered**. It does not include declined referrals or open/unfilled shifts, so true unmet need is understated.
- The caregiver export has no availability data, so weekend/overnight capability is inferred from who actually worked those shifts.
- ZIP codes are mapped to centroids; a handful of out-of-state or unknown ZIPs may not appear on the map but still count in the tables.
- To sharpen the analysis later, add an Open/Unfilled Shifts export and a caregiver availability export.
